

# 臭氧发生系统

## Ozone generation system

Using the principle of high voltage discharge, ionizing oxygen (or air) produces high concentration ozone. The dielectric barrier discharge technology is used to add high voltage alternating current to the high voltage electrode with an insulator in the middle interval and a certain gap, so that the dry purified air or oxygen passes through, and the high voltage discharge is used to produce blue glow discharge (corona). The free high ions in the corona dissociate oxygen molecules, and the ozone molecules are polymerized by collision. The output and concentration of ozone can be adjusted by adding voltage, current and gas volume.

SHOOT ozone generator is composed of air source system, ozone generation system, power supply system, cooling system, control system, ozone dosing/distribution system and ozone tail gas destruction system.

### ● SHOOT oxygen source Ozone generator

Model	Ozone production (kg/h)		Gas yield (Nm <sup>3</sup> /h)		Cooling water flow (m <sup>3</sup> /h)	Unit energy consumption (kWh/kgO <sub>3</sub> )
	Concentration 115g/m <sup>3</sup>	Concentration 150g/m <sup>3</sup>	Concentration 115g/m <sup>3</sup>	Concentration 150g/m <sup>3</sup>		
SHT-O-500G	0.6	0.5	5	3.5	1	6-8
SHT-O-1K	1.2	1	11	7	2	6-8
SHT-O-2K	2.4	2	21	14	4	6-8
SHT-O-3K	3.6	3	32	21	6	6-8
SHT-O-5K	6	5	54	35	10	6-8
SHT-O-10K	12	10	107	70	20	6-8
SHT-O-15K	18	15	161	105	30	6-8
SHT-O-20K	24	20	214	140	40	6-8
SHT-O-30K	36	30	321	210	60	6-8
SHT-O-40K	48	40	429	280	80	6-8
